

Empirical rejection frequency under H_0 ($\alpha = 5\%$)

$\pi = 0.75$ 2000 replications per scenario $h = 1$

Scenario A ($m = 3$, $p = 0.20$)

Scenario B ($m = 10$, $p = 0.45$)

Test statistic — Uncorrected — Bias-corrected

Test statistic — Uncorrected — Bias-corrected

Dashed grey line: nominal 5% level. Uncorrected test over-rejects at small n ; bias-corrected test achieves better level control.
